HPCM MONITORING PIPELINE VISUALIZATION

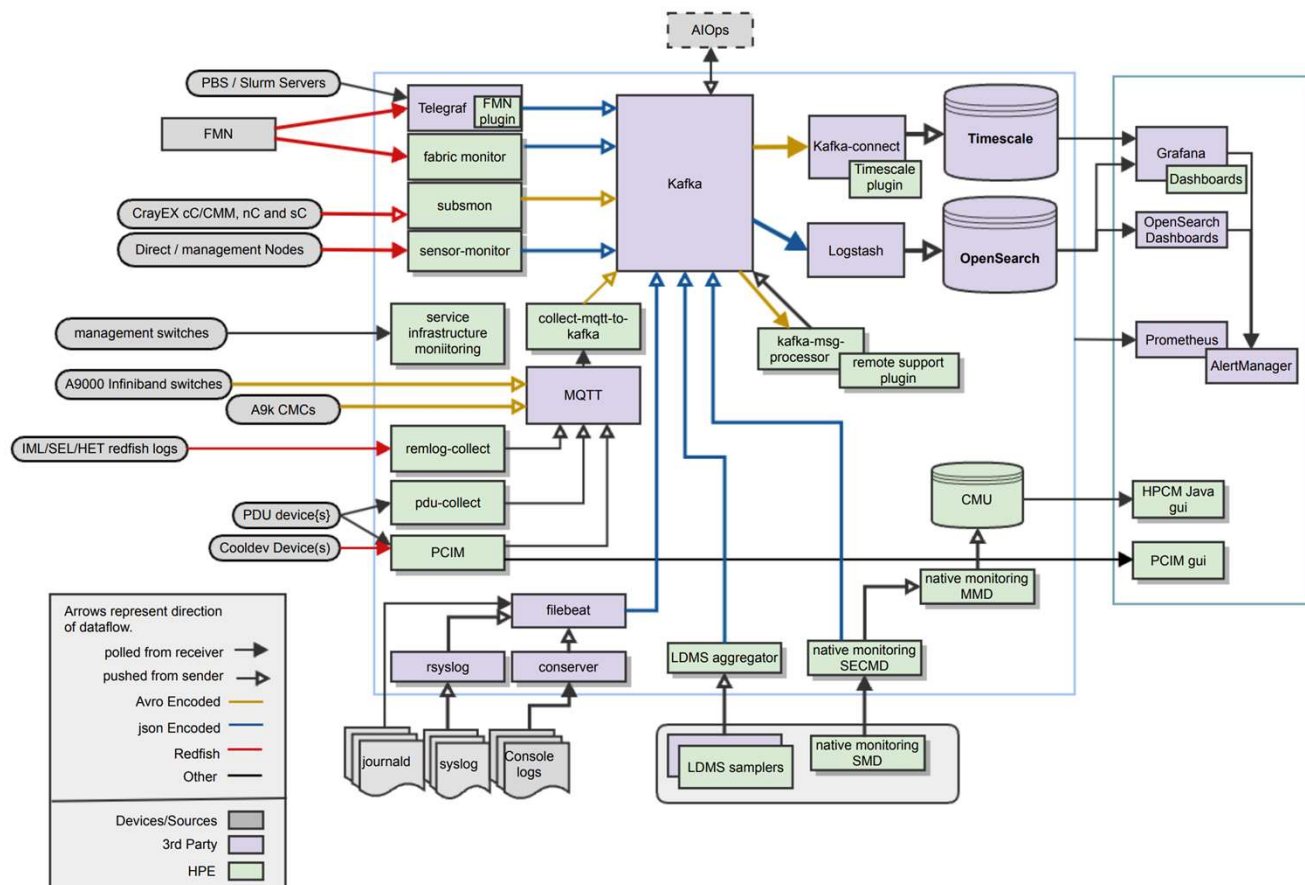

Vidyavardhaka College Of Engineering

CTY Members – Akshay G , Chandana L, Chinmai H K , Abhilash T R , Srivarshini S

Raghul Vasudevan

March 12 2024

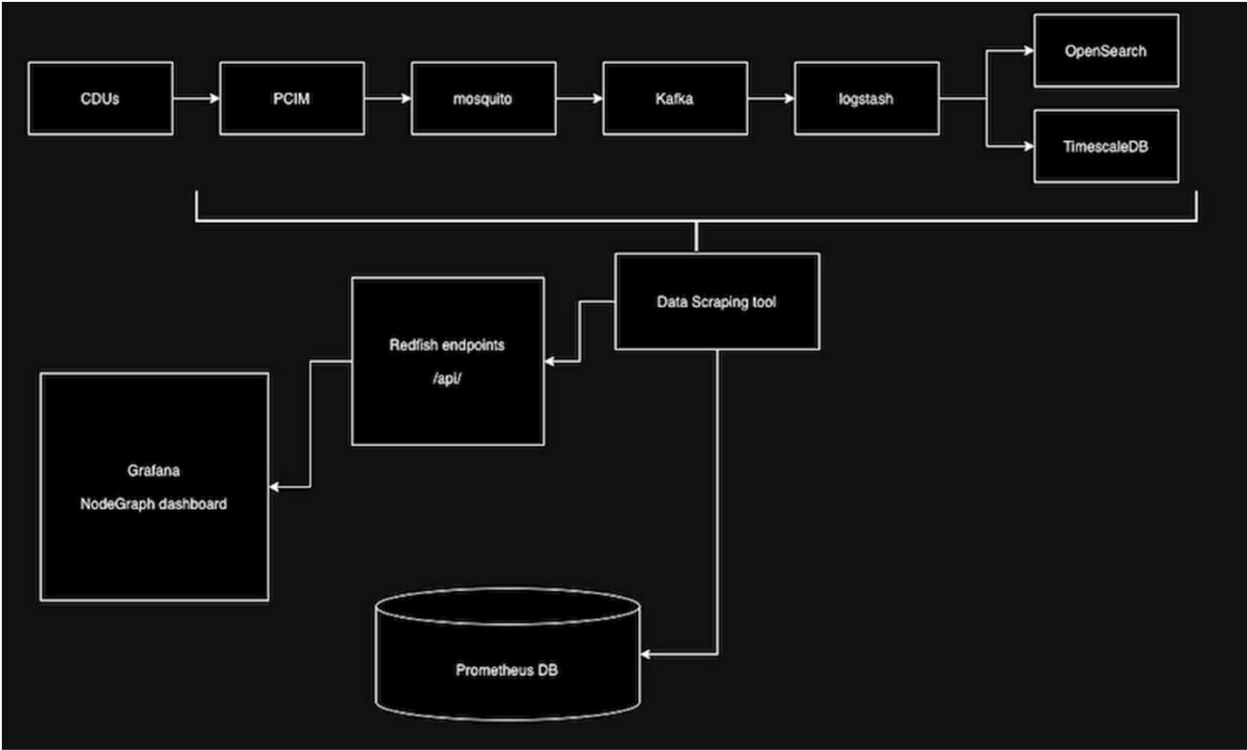

PROBLEM STATEMENT

- Currently, the user must run different set of commands or mon service status check to debug the respective monitoring pipeline to find the issues.
- The end user/customer finds difficulty in understanding the HPCM monitoring stack and pipelines. (including Support and on-site folks).
- The purpose of this project is to reduce the difficulty in debugging the monitoring stack/components/services and pipelines for the customer and support team.

PROJECT ARCHITECTURE, OBJECTIVES AND SKILL

Architecture (Diagram below)

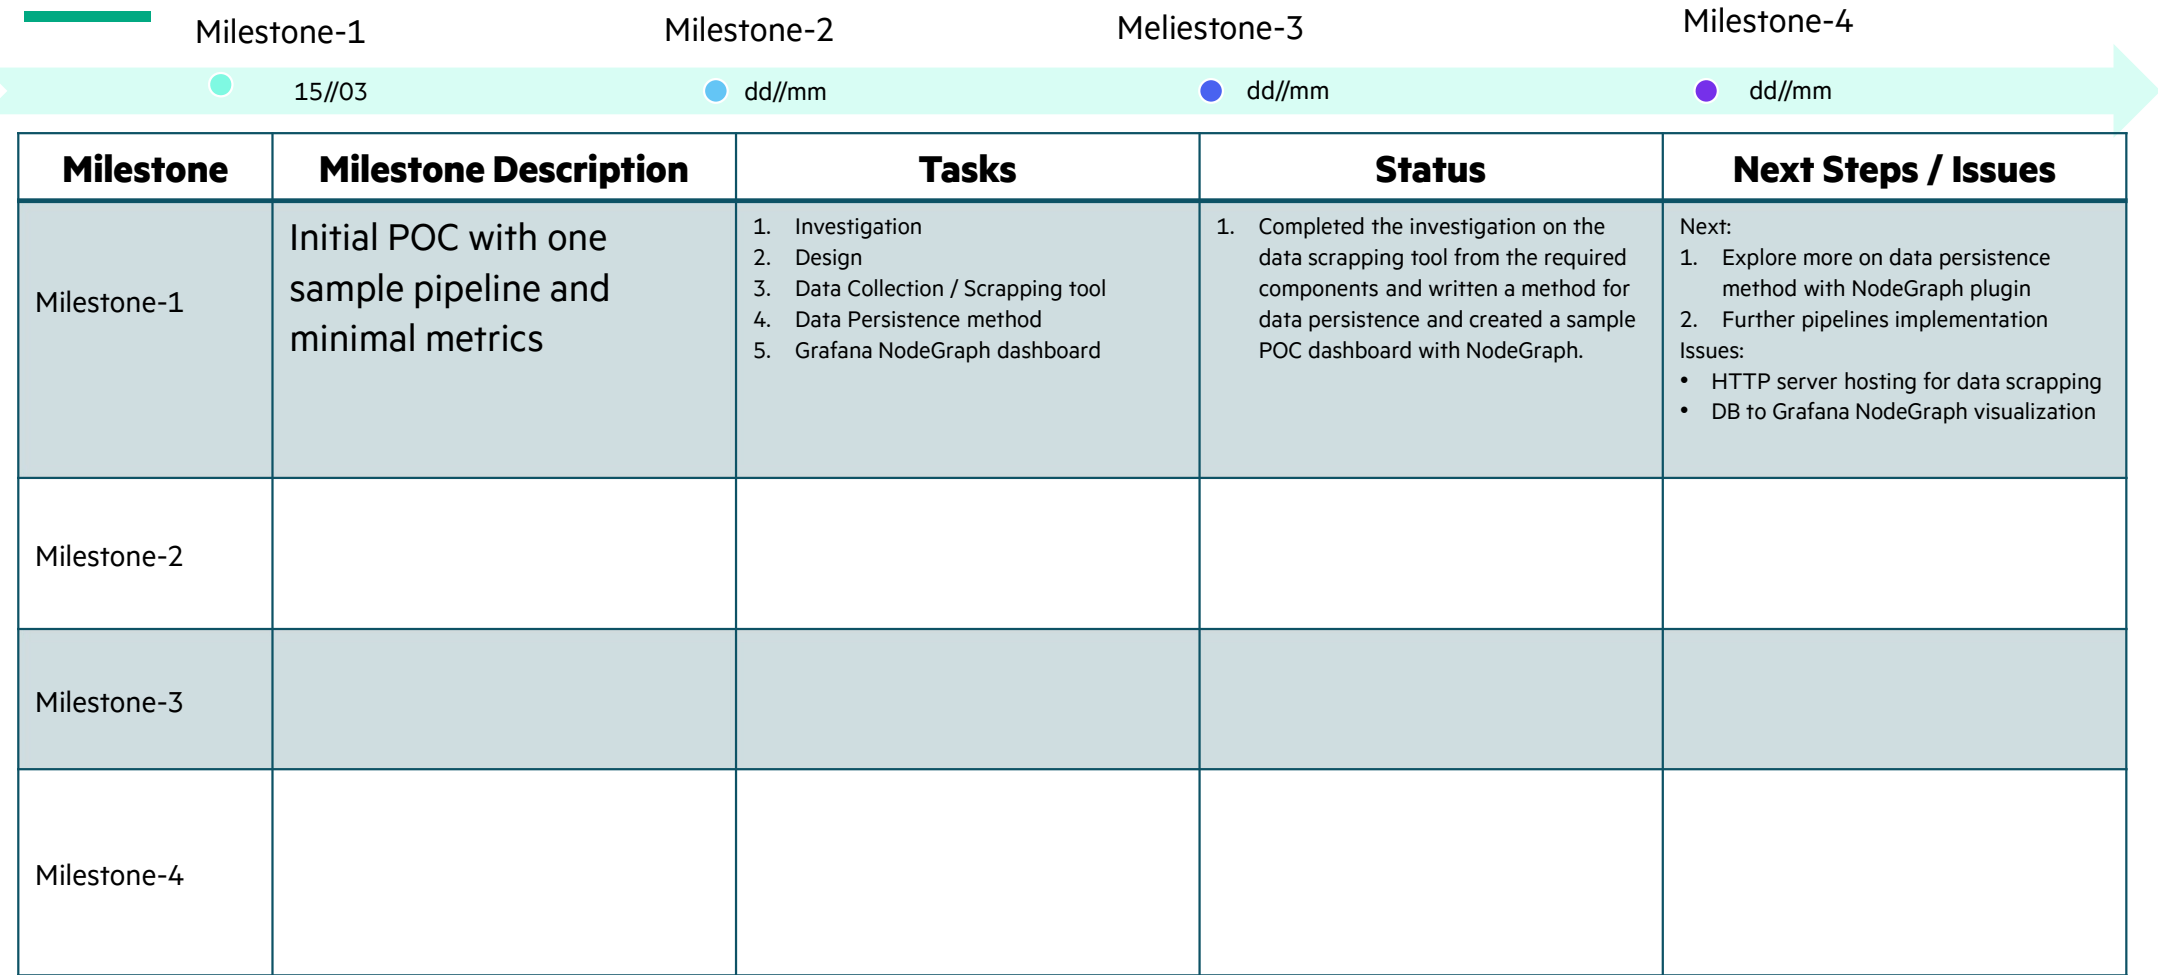

Objectives

1. Data scraping from components of the pipeline.
2. Real-time monitoring.
3. Visualization of status of the pipeline.

Skill Set

1. Programming language - Python
2. Grafana : Nodegraph API Plugin
3. Linux Operating Environment
4. RedFish End-Point

PROJECT TIMELINE , MILESTONE , STATUS

AGENDA

- About the Identified monitoring pipeline – CDU and Schema design
- Data collection / scrapping – components involved in pipeline
- Data persistence
- Grafana NodeGraph dashboard
- Demo

SCHEMA DESIGN – CDU MONITORING PIPELINE

- Chosen metrics has been added in the data collection tool for POC.
- Further metrics will be added for every components later.

SERVICES	STATUS	UPTIME	DATA FLOW
PCIM	Running	Since 2 days	0/1
Mosquitto	Active/Inactive	24hrs	0/1
Kafka	Active/Inactive	Since 10 days, 23hrs	0/1
Logstash	Active/Inactive	Since 12 days, 10hrs	0/1
Opensearch	Active/Inactive	Since 25 days, 5hrs	0/1

DATA COLLECTION/ SCRAPPING

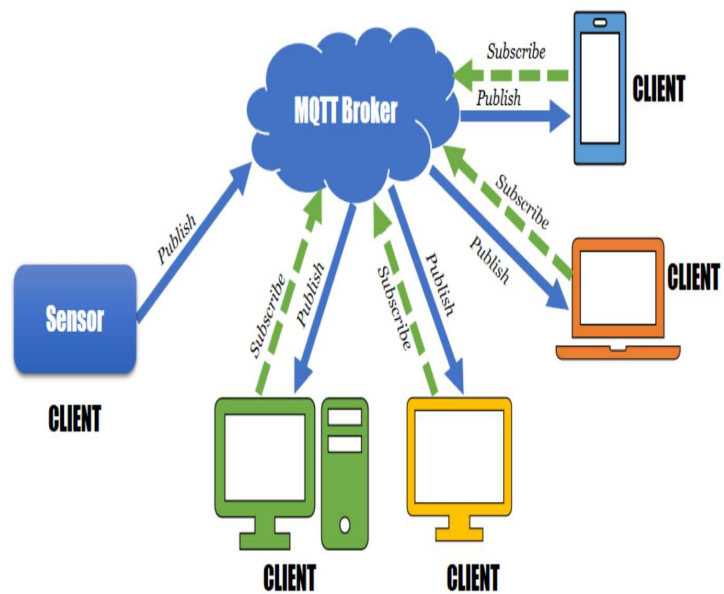

- Mosquitto
- Apache Kafka
- Logstash
- OpenSearch

- Installed the above services and configured to run it as a service
- Extracted the status and uptime using the subprocess module of python
- The extracted status is inserted into a redfish endpoint
- This process is done every 5 seconds to fetch us a time series data structure.

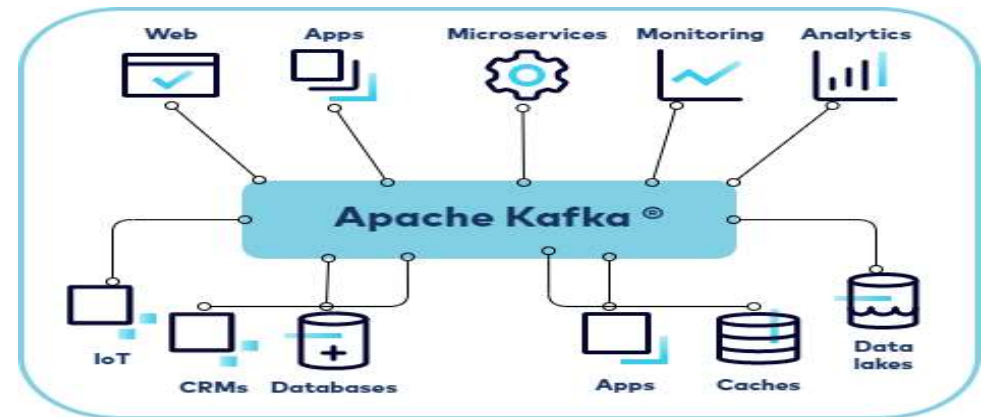

ABOUT COMPONENTS

Mosquitto

Apache Kafka

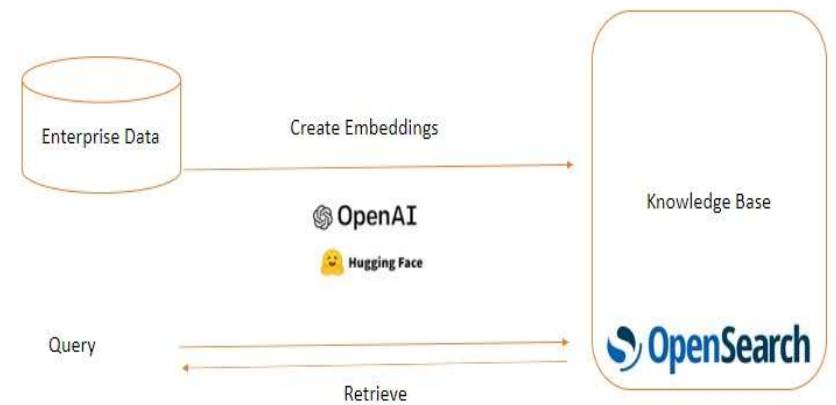

DATA COLLECTION/ SCRAPPING

Logstash

OpenSearch

OPENSEARCH DATA FLOW CHECK

```
[srivarshini@localhost ~]$ python status.py
Enter your username:admin
Enter your password:admin
OpenSearch service is: Active
[srivarshini@localhost ~]$ python createind.py
enter the index name: pdu
Index created successfully.
[srivarshini@localhost ~]$ python index.py
enter the index name: pdu
Document added successfully.
[srivarshini@localhost ~]$ python dataflow.py
enter index name: pdu
The index 'pdu' exists.
Indexing rate for 'pdu': 1 documents.
[srivarshini@localhost ~]$
```

OpenSearch service status has been extracted and an index named pdu has been created and data has been injected into it dataflow for that index has been verified

DATA PERSISTENCE - API SERVER

The screenshot shows a web browser window with the address bar displaying `127.0.0.1:5000/api/graph/data`. The browser tabs include "127.0.0.1:5000/api/graph/dat...", "Edit panel - New dashboa...", and "Server Not Found". The browser's address bar also shows `127.0.0.1:5000/api/graph/data`. The browser's bookmark bar shows "Customer Portal", "Red Hat", "Red Hat Products Doc...", "Red Hat Enterprise Lin...", and "Red Hat Developer Por...". The browser's content area displays a JSON response in the "JSON" tab. The JSON response is a graph data structure with edges and nodes.

```
edges:
  0:
    id: "1"
    mainStat: "1"
    source: "1"
    target: "2"
  1:
    id: "2"
    mainStat: "1"
    source: "2"
    target: "3"
nodes:
  0:
    arc_failed: 0.7
    arc_passed: 0.3
    detail__role: "extrct(IOT)"
    id: "1"
    mainStat: "Active"
    title: "Mosquitto"
  1:
    arc_failed: 0.5
    arc_passed: 0.5
    detail__role: "Stream"
    id: "2"
    mainStat: "Active"
    title: "Kafka"
  2:
    arc_failed: 0.3
    arc_passed: 0.7
    detail__role: "Load"
    id: "3"
    mainStat: "Active"
    title: "Prometheus"
```

GRAFANA - NODEGRAPH

- Grafana Node Graph is a plugin for Grafana that provides a specialized visualization panel for displaying interconnected nodes and edges.
- Grafana Node Graph API, on the other hand, is a separate component or functionality that allows interaction with the Grafana Node Graph plugin programmatically through an API interface.
- Node Graph API is an API interface that allows programmatic interaction with the node graph visualization.

DEMO AND NEXT STEPS

Demo Objective

1. **How status is collected presently**
2. **Executing the code**
3. **Presenting the API endpoint**
4. **Grafana- Visualization of services**

Next Steps

1. **Checking the status of data flow between the components.**
2. **Integrating more pipelines.**
3. **Multiple pipelines visualization.**

PROJECT PLAN , LEARNINGS , CHALLENGES

Learnings

- 1. **Linux Operating Environment**
- 2. **Components – Kafka, Mosquitto, Logstash, Opensearch**
- 3. **Prometheus DB**
- 4. **Grafana - Dashboard**

Challenges

- 1. **Prometheus**
- 2. **Nodegraph vs API plugin**
- 3. **API Endpoints – Multiple and Single**

THANK YOU
